

Ring binder filing solutions providing certified fire protection for up to two hours and optimising storage capacity

Binder Fire File

FIRE RESISTANT DOCUMENT PROTECTION

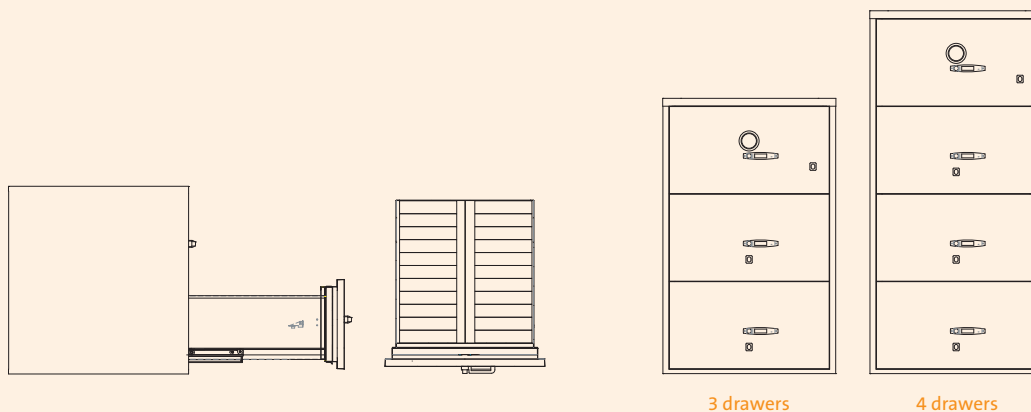

Key features

- Certified UL Class 350 Endurance protection by UL for up to two hours
- Maximised storage capacity that allows users to gain full advantage for their storage requirements. Chubb Safes Binder Fire File is available with 3 or 4 drawers and each drawer holds up to 40 A4 DIN 33mm binders, hence 120 and 160 binders in the three drawer and four drawer versions respectively. By comparison, a standard free standing cabinet with five levels of storage each of 1m length can only hold 150 such binders. Thus the Chubb Safes Binder Fire Files are the perfect storage solution for the congested offices.
- Insulation between drawers means each drawer's contents are protected in an event of fire if one drawer is left open
- Easy operable day catch to secure the drawers when closed. Units do not have to be locked to provide fire protection but just be pushed closed
- High-quality steel sliders to ensure comfortable operation and full drawer access
- Low-weight cabinets for reduced transportation and installation costs, and lighter floor loads.
- All models fitted with high-security locks as standard
- Light grey, powder-coated finish and modern design which blends nicely into any office environment
- Chubb Safes Binder Fire File is manufactured in accordance with ISO 9001 for quality management systems and ISO 14001 for environmental management systems

Fire Testing

The Chubb safes Binder Fire File cabinets are tested and certified according to the most common and well-established UL 72 (Underwriters Laboratories) standard, Class 350 2 hour Fire Endurance. The product is subjected to extensive fire testing which simulates the impact of a severe fire. This two-step process includes the following:

Step 1

The filing cabinet is placed in a furnace and heated to a temperature of 1049 degrees C over a two hour period. After two hours the furnace is turned off and the unit allowed to cool naturally. Internal temperatures are monitored until the unit returns to ambient temperature when the test is considered to have finished. At no time can the internal temperature exceed 177°C (or 350°F).

Step 2

Fire Explosion or Shock Test. To simulate sudden heating, possibly as a result of rapid fire spread, the cabinet is inserted into a preheated furnace. The stresses and strains such rapid heating creates can easily cause a poorly constructed unit to fail.

At all times internal temperatures are not allowed to exceed those set for the Step 1 fire endurance test.
